

## **DESCRIPTION**

The Thermometry Laboratory performs measurements in the areas of thermal conductivity, thermal diffusivity, determination of specific heat of materials, and thermal expansion of solids, powders, and selected liquids.\*

## **ADVANTAGES**

- testing a wide range of materials, including ceramics, metals, polymers and composites;
- high precision and wide temperature range for conducted tests;
- possibility of obtaining higher-quality products in terms of thermal conductivity or thermal insulation;
- possibility of improving technological processes in the company that are affected by temperature changes.
- \* Accredited testing will be carried out starting in 2026

## INTENDED USE

- construction industry testing insulators, concrete, aggregates, and structural metals;
- ceramics industry measurements of thermal expansion and material shrinkage;
- energy industry testing thermal insulation of power cables and district heating insulation;
- food industry testing for vegetable and fruit processing plants, meat processing plants, dairy plants, and distilleries to assess parameters affecting the proper course of technological processes;
- chemical industry measurements of polymer materials, composites, new liquid and solid materials, foams, powders, and coatings;
- pharmaceutical industry measurements of parameters essential for the proper course of the drug manufacturing process
